Ednilson Luis Meza Corilla

(Web Developer)

Lima, Perú · luismeza.com · +51 924188553 · ednilsonluis.11@gmail.com

---

Full-stack developer with experience in end-to-end web application development. On the frontend, I work with modern technologies to create clear, functional, and high-performing interfaces, always prioritizing the user experience. On the backend, I develop and maintain business logic, working with relational databases and complex multi-table structures, ensuring system consistency, efficiency, and scalability. I have an intermediate level of English and am characterized by responsibility, punctuality, and a results-oriented approach. I value teamwork, effective communication, and a commitment to quality in every project I undertake.

EXPERIENCE

Centro Odontologico Especializado Maxillaris (25/01/2025 – 20/12/2025)

- Developed new processes and provided support for the company ERP system.
- Implemented WebSockets with Socket.IO for real-time communication.
- Built new projects using React and Next.js under a micro-frontend architecture.
- Maintained and supported a legacy Angular system.
- Developed new backend services using NestJS and PostgreSQL.
- Implemented full integration between CRM and ERP systems.

Alticsa

(29/12/2025 – Now)

- Provide support for a website developed in WordPress.
- Implementation of new functionalities at the frontend and backend in an ERP developed with React and NestJS.
- Implementation of new functionalities at the frontend and backend in an ERP developed with Next.js and FastAPI.

PROJECTS

SHOP-CO *shop-co.com*

E-commerce platform that allows users to register, buy, and sell products in a collaborative environment. It includes product management, shopping carts visible to all users, and integrated payment processing via the PayPal API. Its architecture is geared towards secure transactions and scalability.

- Designed and implemented the complete PostgreSQL database architecture.
- Developed the full backend using NestJS with PayPal payment integration.
- Dockerized frontend and backend for faster deployment.
- Built the front-end using a layered architecture, separating the presentation layer, business logic layer, service layer, and utilities layer.

pulse.com

Pulse

A Discord-inspired real-time messaging platform that allows users to join channels, create public and private channels, and communicate simultaneously via real-time chat. Built with WebSockets for low latency and live events, it uses Angular on the frontend and a scalable, collaboration-oriented backend architecture.

- Designed the database architecture using normalized relational tables.
- Implemented real-time chat using WebSockets with Socket.IO.
- Built the frontend with Angular using signals for improved performance.

Vansi

A web platform for learning and practicing English using a conversational agent with text and voice support. Users can maintain chat sessions saved in a database, with a tutor who adapts the language to the student's CEFR level. It incorporates RAG: query embeddings, vector search in Chroma on CEFR reference material, and context injection into the model's instructions to substantiate rules and examples without mixing levels. Voice support includes transcription (Whisper/Faster-Whisper) and synthesis (Edge TTS). The architecture is a REST API with FastAPI, persistence in MongoDB, and JWT authentication, designed to separate the client (React + Vite) from AI services executed via Ollama (LLM and embedding model).

- Designed and organized the persistence in MongoDB (Engine): collections for users, chats, conversation messages, English agent configuration, and student error logging.

- I implemented authentication with email and password (registration and login), password hash, and JWT issued and read via an httpOnly cookie. On the frontend, I integrated login/registration flows, a client API with credentials, and protected routes.
- I implemented the product core on the backend: the English agent API (chat with Ollama), the CEFR RAG (embeddings + Chroma + context in the system prompt), voice (transcription and TTS according to configuration), and logic associated with chats and user preferences.
- Implement an email sending service in the backend

Student Management System (Collaborative Project)

learning.com

A student management system that centralizes the administration of students, courses, professors, and grades. It implements a role-based model (administrator, professor, and student) with differentiated permissions, Google authentication, and an email notification system. Designed to optimize academic processes and institutional control.

- Develop the entire database architecture in PostgreSQL
- Implement all initial backend configuration, database connection, creation of entities, modules, controllers, services, Swagger for documentation
- Implement the authentication system, both front and back, with integration with Google and using JWT.
- Implement an email sending service in the backend

EDUCATION

Certus Institute **Lima, Perú**

Information Systems Architecture (Ongoing) – 2027

ADDITIONAL SKILLS

- Spanish (Native)
- English (Intermediate)
- Angular
- Astro
- Next.js
- NestJS
- PostgreSQL
- FastAPI
- Git
- Tailwind CSS
- MongoDB
